## 1. Topic Selection

I have directly selected a topic for you and explained the reasons. The chosen topic is: Physical AI (Embodied Intelligence).

This is definitely simpler, easier to execute, and more likely to earn high marks.

### 1. Abundant Resources and Easy Demo Creation

Robots, simulation environments, and sensor data are all readily available as open-source resources (e.g., Isaac Gym, MuJoCo). You can easily run a small experiment for demonstration.

### 2. No Need to Tackle Hardcore Scientific Knowledge

AI for Science requires expertise in physics, chemistry, biology, and materials science. If your team is not from a science background, you are likely to get stuck.

Physical AI, on the other hand, focuses on engineering and algorithms, making it accessible to those in computer science/data-related fields.

### 3. Data is Easier to Understand

Physical data consists of sensors, videos, radar, and motion sequences, which are intuitive and easy to explain.

Scientific AI data (e.g., proteins, quantum mechanics, climate) is highly abstract.

### 4. Ideal for a 5-Minute Presentation

Topics like robots, simulation, embodied intelligence, and VLA/WAM models are visually engaging and easy for instructors to follow.

Topic: Demonstration of Embodied Intelligence Tasks Based on Simulation Environments

Content can include:

- Simple robot grasping/movement
- Basic concepts of sim-to-real transfer
- Multimodal sensor data fusion (vision + IMU)
- Running a small experiment using open-source datasets to showcase results

No complex innovation is required. As long as the system runs, includes visuals, and produces results, you will achieve high marks.

Why Physical AI is Simpler

## 2. Final Conclusion

□ Your team should choose: 2) Physical AI (Embodied Intelligence)

It is the simplest, most stable, and least likely to fail.

Do you need me to draft a 5-minute presentation outline for you now?
