

1112.pdf

1. Topic Selection

I have directly selected a topic for you and explained the reasons. The choice is: Physical AI (Embodied Intelligence)

This is definitely simpler, easier to execute, and more likely to earn high marks.

1. Abundant Resources and Easy Demo Creation

Robots, simulation environments, and sensor data are all readily available as open-source resources (Isaac Gym, MuJoCo). You can easily run a small experiment for demonstration.

2. No Need to Tackle Hardcore Scientific Knowledge

AI for Science requires expertise in physics, chemistry, biology, and materials science. If your background is not in the sciences, you are likely to get stuck.

Physical AI, on the other hand, leans toward engineering and algorithms, and can be handled purely from a computer science/data science perspective.

3. Data is Easier to Understand

Physical data consists of sensors, videos, radar, and motion sequences—intuitive and easy to explain.

Scientific AI data (proteins, quantum, climate) is highly abstract.

4. Ideal for a 5-Minute Presentation

Robots, simulations, embodied intelligence, VLA/WAM models—these are visually compelling and engaging for the audience.

Topic: Demonstration of Embodied Intelligence Tasks Based on Simulation Environments

Content can include:

- Simple robot grasping/movement
- Basic concepts of sim-to-real
- Multimodal sensor data fusion (vision + IMU)
- Running a small experiment using open-source datasets to present results

No complex innovation is required. As long as it runs, includes visuals, and shows results, you will get a high score.

Why Physical AI is Simpler

Here is the simplest topic direction for your group (use it directly):

-

-

2

□ Your group should choose: 2) Physical AI (Embodied Intelligence)

It is the simplest, most stable, and least likely to go wrong.

Do you need me to draft a 5-minute presentation PPT outline for you now?

Final Conclusion
