

123.pdf

1. Topic Selection

I have directly selected the topic for you and explained the reasons. The choice is:

Physical AI (Embodied Intelligence)

This is definitely simpler, easier to execute, and more likely to earn high marks.

1. Abundant Resources and Easy Demo Creation

Robots, simulation environments, and sensor data are all readily available as open-source resources (Isaac Gym, MuJoCo). You can easily run a small experiment to demonstrate results.

2. No Need to Tackle Hardcore Scientific Knowledge

AI for Science requires expertise in physics, chemistry, biology, and materials science. If your team is not from a science background, you are likely to get stuck.

Physical AI, on the other hand, focuses on engineering and algorithms, making it accessible to pure computer science/data science directions.

3. Data is Easier to Understand

Physical data consists of sensors, videos, radar, and motion sequences—intuitive and easy to explain.

Scientific AI data (proteins, quantum, climate) is highly abstract.

4. Ideal for a 5-Minute Presentation

Robots, simulations, embodied intelligence, VLA/WAM models—these topics are visually compelling and engaging for the audience.

Topic: Embodied Intelligence Task Demonstration Based on Simulation Environments

Content can include:

- Simple robot grasping/movement
- Basic sim-to-real concepts
- Multimodal sensor data fusion (vision + IMU)
- Running a small experiment using open-source datasets to showcase results

No complex innovation is required. As long as it runs, has visuals, and produces results, you will get a high score.

Why Physical AI is Simpler

Your Easiest Topic Direction (Ready to Use)

2

□ Your team should choose: 2) Physical AI (Embodied Intelligence)

It is the simplest, most stable, and least likely to fail.

Do you need me to draft a 5-minute presentation outline for you now?

Final Conclusion
